ATG Access

George Town University, Qatar - Case Study

Location: Doha, Qatar

Brief: To secure the VIP entrance of the main building

Solution: 16 VP200, stainless steel bollards

ATG Access' local partner, ACEC was chosen to design and supply a range of access control bollards to secure the VIP entrance to the George Town University, Qatar.

The Georgetown University in Doha required an increase in the level of security for the main entrance of the School for VIP visitors.

Our local partner, the Arabian Construction Engineering Company (ACEC), proposed the VP200 Stainless steel bollards for aesthetics and intensive use.

Representatives from ACEC visited the site on several occasions prior to obtaining planning permission and were able to advise on ways of making the scheme aesthetically pleasing as well secure.

ATG Access designed a specific system to match the client's requirements with a combination of loop safety detectors.

ACEC undertook all aspects of the project including management of the civil works and installation for the main entrances. This allowed our partner to fully control the project and acquire further business with prestigious clients.

Training courses are regularly provided by ATG Access to ensure our partners learn about the latest engineering and design developments. Civil contractors are also frequently met during local shows.
